

1                   16. (Amended) A method of reducing for cosmetic  
2                   purposes the amount of subcutaneous adipose tissue at  
3                   selected locations in a human body, which comprises  
4                   introducing into said tissue about 5 to about 150 ABC units  
5                   of collagenase per gram of adipose tissue treated, the  
6                   collagenase dissolving adipose tissue's connective tissue,  
7                   and the body metabolizing fat released by said digested  
8                   connective tissue, leaving said selected location with a  
9                   reduced amount of said adipose tissue.
